

## Exercise 23.2 – RMI for the Bank Application

### The Setup:

In this exercise, we will extend the bank application to make the `AccountService` available over RMI as well. Start by copying the **exercise12\_2** project to **exercise23\_2**, and then create a second project called **exercise23\_2-RMIClient**

### The Exercise

Update the existing code so that when `Application.java` is run, the `AccountService` class will remain available for RMI calls.

Then, create a separate application called **RMIApplication.java** that calls the `AccountService` methods over RMI. Feel free to re-use the `deposit`, `transfer` and `getAllAccounts()` calls that `Application.java` also uses.
